EMERGENCY INFORMATION EHLERS-DANLOS 🕀

HANDLE THIS PATIENT WITH GREAT CARE.

Joints may be lax and dislocate easily.

- Skin tearing, splitting and bruising are common.
 Mitral Valve Prolapse, umbilical and inguinal hernias may be present. Arterial or intestinal rupture commonly presents as acute abdominal or flank pain. that can be diffuse or localized.
- Cerebral arterial rupture may present with altered mental status and be mistaken for drug overdose.
- Emergency procedures (especially for Vascular EDS) often require trauma, vascular surgery, ICU. Elective surgery and procedures should be avoided whenever possible. Non-invasive testing is highly preferred.
- possible. Non-invasive testing is fignity preferred.

 Healing may be delayed, with irregular scarring. Use alternatives to sutures whenever possible. Retain sutures/staples for twice the normal period; watch for wound reopening and dehiscence.
- Anesthetists should use caution upon intubation, as jaw dislocation is common.
- · Local anesthestics are usually inadequate or short-lasting.
- Potential spinal and/or cerebullar involvement may increase general anesthetic and surgical risks.
